Check out the Valentine's Day sale. These deals are only available on Valentine's Day. Pilots can now redeem the unique serial number to receive a special Valentine's Day sale. Go to the "Terms & Conditions" page of the website, click on the "Redeem Special Offer" button to redeem the code, and pay \$35. This will give you the special price of \$24.95 per month for one year. The 10% discount, in fact, is an exclusive offer and can only be redeemed once a month. This offer is only available for the first 90 days. After 90 days, your subscription will revert to its regular price of \$25 per month. A bonus Deal is the Jan 2018 +1A selection in. I use the mouse for the selection and the keyboard for the Y-axis control. A late check in allows a lot of different options in the initial selection. The second mouse allows me to carefully check details in my new selection. It works great. I am in the planning stages of another Y-axis aircraft for my next selection. Question for owners of the Y-axis: Have you had any issues with the controllers? I've been using mine a lot recently, and for the most part, it's working fine. I have a few issues that I'll have to dig into. For example, I keep having the wrong axis displayed. For instance, I may be targeting the ground at 2000 feet and get 2000 feet on the y-axis on the ground. Note that adblockers might block our captcha, and other functionality on BHW so if you don't see the captcha or see reduced functionality please disable adblockers to ensure full functionality, note we only allow relevant management verified ads on BHW.Q: Three Point Coordinates To Screen Coordinates in WebGL. I have two questions: 1) how to convert a three point's coordinates to screen coordinates in WebGL. 2) how to convert the inverse, i.e., the screen coordinates to three point's coordinates. Edit: I also tried with these two solutions, but none of them work, they only calculate the XYZ to screen coordinates and not the screen coordinates to XYZ. A: You can take a look at: 82157476af
